

## InterAct 4

### One software. Many possibilities.

Erideon envisions a world where software is driven by imagination, formed into a reality through the visual and versatile tools of InterAct4 platform. Backed with over ten years of innovation and customer feedback, InterAct4 has finally become the software solution that is uniquely simple to the end-users yet powerful and sophisticated enough to drive the organisation's complex processes.

**InterAct4** is a **cloud-optimised business process & collaboration platform** that drives processes, business rules and information flow, leading to dramatic reductions in operating costs and time lags while maximising strategic contribution from employees, customers, suppliers and other key stakeholders. With the flexibility of InterAct4 sitting on premise, on cloud or on both, organisations can leverage on easily enabling on-demand access to limitless resources, engaging people inside and outside of the organisation without compromising security and enjoying benefits of technology through small recurrent costs instead of large upfront investments. InterAct4 is designed to **fluidly move between environments as it can sit natively on-premise or on the cloud**. It also allows multiple business solutions from various enterprise systems to be plugged into a single engine platform working seamlessly in sync. This permits the deployment of a multi-point solution that allows collaboration with external parties in the organisation's processes without compromising on IT security, while harnessing the benefits of cloud technology.

**InterAct4** provides a **common foundation platform** for most of popular application modules. The modules are easily plugged into InterAct4 foundation and allow for a free flow of data between modules. Integrated as additional functionalities in the current system allowing organisation's to scale up. Most importantly, organisations are able to maintain the ease of single user interface across software services being used and a consistency of experience. New functionalities can be quickly added on with plugged in applications from the ever-growing stack of InterAct-based solutions. The system is able to therein evolve in pace with the ever-changing needs of the organisation, expanding as needs grow whilst retaining same infrastructure or cloud-on-demand resources.

**InterAct4** architecture **separates the foundation engine, the applications and the data into different layers**. Updates and upgrades to the respective layers of foundation engine or application can be done independently and effortlessly, without impact on the existing data. The customisation and configuration of the applications can be easily maintained by the organisation.

**InterAct4** is **subscription based, built on Software as a Service model (SaaS)**. All updates and upgrades in the system form part of the service package. Organisations need not worry about their software being outdated or even obsolete. There is neither software capex involved nor software development life cycle investment risk, since subscription begins only on delivery of the system. It is a Commercial-off-the-shelf (COTS) product that allows organisations to custom-configure processes best-suited for their needs with the built-in designers. Scaling up IT infrastructure becomes just a matter of plugging in additional applications / business solutions, and when needed, supplementing through adding additional servers or purchasing additional user seats. With InterAct4, organisations don't have to pay to own software, they only pay for the benefits the software will provide.
